Project Title :

Optimizing User, Group, and Role Management with Access Control and Workflows

Brainstorm Template :

The brainstorming session for this project focused on developing a secure and efficient User, Group, and Role Management system with workflow automation in ServiceNow. The main goal is to improve access control mechanisms while reducing manual effort and ensuring better security and governance across the system.

During the discussion, several key problems were identified in existing systems. Manual permission management often leads to errors and inconsistencies in access control. This also creates security vulnerabilities where users may have more or less access than required. Another major concern is the lack of automation in administrative tasks, which results in delayed approvals and slower processing of user requests. Additionally, managing users and roles becomes difficult as the system grows, leading to inefficient administration and inconsistent access policies.

Identified Problems

- Manual permission management.
- Security vulnerabilities.
- Lack of automation.
- Delayed approvals.
- Difficult user administration.

Ideation Phase

Brainstorm & Idea Prioritization Template

Ideas Generated

- Create custom Project and Task tables.
- Implement Role-Based Access Control.
- Create Project Manager and Team Member roles.
- Use groups for easier permission management.
- Configure Application Access.
- Create ACLs for sensitive fields.
- Automate task processing using Flow Designer.
- Add approval workflow before task completion.

Selected Ideas

- ✓ User Management
- ✓ Group Management
- ✓ Role Management
- ✓ ACL Configuration
- ✓ Flow Designer Automation
- ✓ Approval Workflow

Expected Benefits

- Improved security
- Faster operations
- Better governance
- Reduced manual work
- Increased efficiency
- Easy administration
