Project Title :

Optimizing User, Group, and Role Management with Access Control and Workflows

The Problem Statements :

Organizations today face significant challenges in managing users, groups, and roles effectively within their IT systems. As the number of employees, applications, and access levels increases, manual handling of access control becomes complex, time-consuming, and error-prone. In many cases, delays in granting or modifying access impact productivity, while inconsistent role assignments can lead to security vulnerabilities and compliance risks.

Another major issue is the lack of streamlined workflows for access requests and approvals. Users often struggle with unclear procedures, delayed responses, and limited visibility into the status of their requests. Administrators, on the other hand, find it difficult to track, audit, and manage access changes efficiently due to scattered processes and insufficient automation.

This project addresses these challenges by focusing on optimizing user, group, and role management through structured access control and automated workflows. The aim is to create a more efficient, secure, and transparent system that reduces manual effort, improves approval speed, and ensures that access rights are assigned accurately based on organizational policies.

Ideation Phase

Define the Problem Statements

Proposed Solution

- Create users, groups, and custom roles.
- Assign users to appropriate groups.
- Configure Role-Based Access Control (RBAC).
- Secure tables and fields using ACLs.
- Automate task updates using Flow Designer.
- Implement approval workflows for better governance.
