Problem Solution Fit:

The proposed system directly addresses the challenges identified in the problem statement, where organizations face difficulties in managing users, groups, and roles efficiently. Manual access control processes often lead to delays, security risks, and inconsistent permission assignments. There is also a lack of proper automation and visibility in approval workflows, making it difficult for administrators to manage access requests effectively.

Problem Area	Proposed Solution
Manual permission handling	Role-Based Access Control (RBAC) implementation
Delayed approvals	Flow Designer automation for approval workflows
Lack of centralized management	User, Group, and Role Management modules
Security vulnerabilities	Access Control Lists (ACLs) enforcement
No workflow automation	Automated ServiceNow workflows
Poor tracking and monitoring	Audit logs and activity tracking system

The solution fits these problems by introducing a structured and automated approach using the ServiceNow platform. Role-Based Access Control (RBAC) ensures that users are assigned permissions based on their responsibilities, reducing unnecessary access and improving security. Group-based management simplifies administration by allowing permissions to be assigned collectively. Additionally, automated workflows using Flow Designer streamline access requests and approvals, eliminating manual intervention

Problem Solution Fit

and reducing delays. Access Control Lists (ACLs) further strengthen security by restricting unauthorized access to sensitive data.
