

Solution Architecture

Solution Architecture:

The architecture of the system is designed using the ServiceNow platform as the core engine, integrating user interaction, workflow automation, security enforcement, and data management.

The system follows a layered architecture where user requests flow from the interface layer to the workflow engine, then to security validation, and finally to data storage. Each layer plays a crucial role in ensuring secure, automated, and efficient management of users, groups, and roles. This architecture ensures scalability, maintainability, and strong security within the ServiceNow environment.
