

PROJECT DEVELOPMENT PHASE

Date	
Team Id	SWTID-2026-8336
Project Name	Optimizing User, Group, and Role Management with Access Control and Workflows
Maximum Marks	

Performance Testing:

The purpose of Performance Testing is to evaluate the responsiveness, stability, and scalability of the User, Group, and Role Management with Access Control and Workflows system. This ensures that the system performs efficiently under normal and peak load conditions without any degradation in performance.

Performance Test Scenarios

The following scenarios were considered during performance testing:

- Multiple users logging into the ServiceNow platform simultaneously
- Concurrent submission of access requests by different users
- Simultaneous approval and rejection of requests by managers
- Execution of workflows using Flow Designer under load conditions
- Role and group assignment operations for multiple users
- Execution of Access Control List (ACL) validations during data access
- Generation and delivery of notifications to users and administrators

Performance Test Observations:

Test Scenario	Expected Result	Actual Result	Status
User Login under load	Fast authentication	No delay observed	Pass
Access Request Submission	Request processed quickly	Processed within acceptable time	Pass
Workflow Execution	Automatic routing without delay	Executed successfully	Pass
Role Assignment	Immediate assignment after approval	Completed successfully	Pass
ACL Validation	Secure and fast access check	No performance impact observed	Pass
Notification Delivery	Instant notification sent	Delivered successfully	Pass

Performance Summary

The system was tested under different load conditions to ensure scalability and efficiency. All major functionalities including login, access request processing, workflow automation, role assignment, and notifications performed within acceptable response times. No critical performance issues were observed during testing.
